Address: Cingrijina 4, Zvezdara, Beograd
Date of birth: 20.05.2003
Marital / family status: Single

About

Software Engineer and Systems Architect specializing in high-performance systems, with a strong foundation in computational logic and algorithmic problem-solving.

Technical and creative problem-solver who thrives on the "why" behind the performance. My experience in full-stack development allows me to navigate the complexities of system coordination and clean-code implementation with a structural edge.

As an early-career professional, I bring an energetic, "can-do" mindset and a researcher's eye for detail. I am a fast-moving, adaptive learner. I treat every project with total commitment, delivering high-quality, organized, and structurally sound code that connects functional requirements with high-level performance.

Projects

January 2026 — **Compiler**

- Built a Java-based compiler for the MikroJava language as part of the Programming Translators course (ETF Belgrade).
- Implemented lexical analysis (JFlex), syntax analysis (AST-CUP/LALR(1)), semantic analysis with symbol table integration, and bytecode generation targeting the MikroJava Virtual Machine.

July 2025 — **Algorithms and Data Structures - Social Media Platform**

- Developed a high-performance Graph-based simulation tool in C++ to model and analyze complex social interactions and user influence.
- Implemented advanced graph algorithms including Pathfinding (Dijkstra/ Shortest Path), Connectivity Analysis, and Influence Ranking to identify key network nodes.
- Engineered a robust CLI for dynamic graph manipulation, supporting custom file parsing and real-time CRUD operations on multi-weighted edges.
- Applied object-oriented principles to manage memory-efficient data structures for large-scale network modeling.

Sep 2025 — **Full-Stack Hospitality & Reservation Platform (MEAN)**

- Architected a full-stack booking engine using Angular and Node.js, mirroring the end-to-end user journey of platforms like Booking.com.
- Implemented secure image upload functionality, enabling hosts to manage high-resolution property galleries with optimized storage.
- Integrated Leaflet and Chart.js to deliver interactive property maps and dynamic analytics dashboards with real-time visual data.
- Designed a Review & Rating system in MongoDB using aggregation pipelines to calculate and display live property scores.
- Managed complex data streams with TypeScript, ensuring reactive and consistent UI across multi-step reservation flows.

June 2024 — **Brick Breaker Game - Java AWT**

- Built a popular game called brick breaker leveraging Java AWT. Main focus of the project was object oriented design, and engineering.

February 2026 — **Hackathon Project - Email Phishing Detection**

- Cybersecurity platform built at 201:GO! Hackathon (Hub201, Belgrade). Developed a browser extension for real-time phishing email detection, an educational module with personalized security scoring, and a corporate admin panel for phishing simulations and team analytics.

Education

Faculty of Electrical Engineering Belgrade University, Serbia

Computer Science
Oct 2022-Present

5th Belgrade Gymnasium - Serbia

Mathematics
Sept 2018-Sep 2022

Skills & Expertise

System Design & Architecture
Data Structures & Algorithms
API Design & Integration
Database Management
Front-End Development
Back-End Development
Mobile App Development
Integration Testing
Performance Optimization
Security Best Practices
Agile/Scrum Methodology

Toolstack

C
C#
C++
Java
Python
Linux
JavaScript/Angular
Three.js
HTML/CSS
Arduino
Assembler
Git/Github
Claude
Vulkan
SQL
MongoDB

Language

Serbian - Native

English - Fluent
